Title

Paleoenvironmental reconstructions of the Late Pleistocene deposits of (Northwestern) Spitsbergen, Svalbard -constraints from benthic foraminiferal records

Science Keywords

Category	Land Surface
Topic	Erosion/Sedimentation
Expedition Year	2018-2019
ISO Topic	Meteorology

Summary

Abstract

The main objective of the project is to understand how the environment has varied in the past. Additionally, we want to use our data to test if microfossil assemblages can help to improve correlation with sedimentological and absolute chronology data-sets we can identify similar paleoenvironmental conditions in different lithological successions at different locations of the Svalbard archipelago

Purpose

The main objective of the project is to understand how the environment has varied in the past. Additionally, we want to use our data to test if microfossil assemblages can help to improve correlation with sedimentological and absolute chronology data-sets we can identify similar paleoenvironmental conditions in different lithological successions at different locations of the Svalbard archipelago
