## Title

Paleoenvironmental reconstructions of deposits of Kongsfjorden in the Svalbard region, based on a multi-proxy approach

---

## Science Keywords

Category	Land Surface
Topic	Erosion/Sedimentation
Expedition Year	2016-2017
ISO Topic	Meteorology

## Summary

---

### Abstract

The main objective of the project is to understand how the environment has varied in the past. Additionally, we want to use our data to test if microfossil assemblages can help to improve correlation with sedimentological and absolute chronology data-sets . we can identify similar paleoenvironmental conditions in different lithological successions at different locations of the Svalbard archipelago.

### Purpose

The main objective of the project is to understand how the environment has varied in the past. Additionally, we want to use our data to test if microfossil assemblages can help to improve correlation with sedimentological and absolute chronology data-sets . we can identify similar paleoenvironmental conditions in different lithological successions at different locations of the Svalbard archipelago.
